Description of remains, precise location and stratification (attach plans if necessary)

The two fields as marked on the O.S. 6" map are one and the old boundary still being very marked by a stone bank and the differing colour of the soil in the two parts.

The vast majority of the pot sherds found were of post medieval types. Of five sherds were of a possible (13) date, having a buff or pink surfaces with a grey core, all having a gritty texture. One sherd with a yellow/buff interior and a grey 'burnished' outer surface, the fabric was a gritty tempered type.

A number of sherds of Midland Black, Cistercian Ware + Midland Purple were found with two sherds of slip coated ware (Tigg ware).

3 possible waste flint flakes were also found.

Conclusions

General field scatter.
